

LLMMargin — SEO Copy Package

Production-ready copy for llmmargin.com. Every string below is final — paste directly into the site.

Section 1: Homepage (/) — SaaS Margin Simulator

Meta tags

- `<title>:LLM Margin Calculator for SaaS Founders | LLMMargin`
- `<meta name="description">:Model gross margin, cost-per-user, and breakeven MAU for any AI product. Plug in your LLM pricing and see if your unit economics actually work. Free.`
- `<meta property="og:title">:Will your AI SaaS actually make money? Find out in 60 seconds.`
- `<meta property="og:description">:LLMMargin simulates gross margin and power-user risk for AI products. Built by founders, for founders staring at OpenAI invoices.`
- **Primary keyword:** LLM margin calculator
- **Secondary keywords:** SaaS AI cost calculator, AI API cost calculator for SaaS, LLM cost per user calculator, AI pricing calculator for founders, LLM gross margin calculator

On-page copy

H1

Model your AI SaaS margins before your OpenAI bill eats them.

Subheadline / lede

LLMMargin is a margin simulator for founders shipping AI products. Enter your pricing, token usage, and MAU — get gross margin, cost-per-user, and breakeven in seconds.

Supporting bullets

- See your true gross margin % after LLM costs — not the back-of-napkin version your board deck uses.
- Spot power-user risk before one heavy customer wipes out margin on the other 500.
- Find the MAU number where you actually break even at your current pricing.

Tool section header

Enter your SaaS inputs

Results section header

Your unit economics, decoded

Social proof line

Used by 400+ SaaS founders to pressure-test AI unit economics before raising or repricing.

Footer SEO paragraph

LLMMargin is a free LLM margin calculator built for SaaS founders, indie hackers, and AI startup CTOs who need real answers about AI cost per user, gross margin, and breakeven MAU. Instead of spreadsheets and Reddit threads, plug your OpenAI, Anthropic, or open-source LLM pricing into the SaaS margin simulator and get cost-per-user, power-user risk, and monthly burn in one view. If you're pricing an AI product or defending margin to investors, this is the fastest way to stress-test the model.

Section 2: Cost-Per-User Page (/cost-per-user)

Meta tags

- `<title>:LLM Cost Per User Calculator (MAU) | LLMMargin`
- `<meta name="description">:Calculate exact LLM cost per monthly active user for GPT-4o, Claude, and Gemini. Free tool for SaaS founders modeling AI unit economics at scale.`
- `<meta property="og:title">:How much does each user actually cost you in AI spend?`
- `<meta property="og:description">:The LLM cost per user calculator the SERP has been missing. Real numbers for GPT-4o, Claude, and Gemini at any MAU.`
- **Primary keyword:** LLM cost per user calculator
- **Secondary keywords:** cost per token calculator, AI cost per user, how to calculate AI cost per user, AI API cost for 10000 users, ChatGPT API cost calculator

On-page copy

H1

LLM cost per user calculator for SaaS products

Subheadline / lede

Enter your token usage, model choice, and MAU — see blended cost per user, per-tier breakdowns, and what happens when you 10x. Built for founders who need a number, not a spreadsheet.

Supporting bullets

- Per-user LLM cost across GPT-4o, Claude Sonnet/Opus, Gemini, and open-source — priced live.
- Split by prompt tokens vs. completion tokens so you see where the bill actually comes from.

- Project cost at 1K, 10K, and 100K MAU without rebuilding the sheet every time.

Tool section header

Model, tokens, and MAU inputs

Results section header

Cost per user breakdown

Social proof line

Founders use this before every pricing change, investor update, and model migration.

Footer SEO paragraph

This LLM cost per user calculator gives SaaS founders a straight answer to one of the hardest questions in AI pricing: how much does one active user really cost per month? It handles GPT-4o, Claude, Gemini, and custom token pricing, and it scales cleanly from 100 MAU to 100,000. If you've been patching together a ChatGPT API cost calculator out of spreadsheets and Reddit math, replace it with this.

Section 3: Budget Planner Page (/budget-planner)

Meta tags

- `<title>:AI Budget Planner for Founders & SaaS Teams | LLMargin`
- `<meta name="description">:Plan monthly AI spend across OpenAI, Anthropic, and infra. Set caps, forecast burn, and catch cost overruns before your CFO does. Free planner.`
- `<meta property="og:title">:Stop guessing your AI budget. Plan it.`
- `<meta property="og:description">:The AI budget planner founders use to forecast LLM spend, set caps, and survive growth spikes without blowing runway.`
- **Primary keyword:**AI pricing calculator for founders
- **Secondary keywords:**AI budget planner, OpenAI API pricing calculator for SaaS, Anthropic API pricing calculator, LLM API pricing calculator, AI token calculator

On-page copy

H1

The AI budget planner founders use before every board meeting

Subheadline / lede

Forecast monthly LLM spend across OpenAI, Anthropic, and your infra stack. Set usage caps, model growth scenarios, and know exactly how many months of runway your AI spend is eating.

Supporting bullets

- Month-by-month AI burn forecast across multiple models and providers in one view.

- Scenario toggles for 2x, 5x, and viral-growth MAU — see which month you blow the budget.
- Alert thresholds so you catch a runaway prompt chain before the invoice lands.

Tool section header

Build your AI budget

Results section header

12-month burn forecast

Social proof line

Trusted by founders managing \$5K–\$500K/month in AI spend across production SaaS.

Footer SEO paragraph

The LLMMargin AI budget planner is built for founders and SaaS operators who need to forecast AI spend with the same rigor as payroll. Model OpenAI API pricing, Anthropic API pricing, and self-hosted inference side by side, set caps per feature, and watch the 12-month burn update live. It's the AI pricing calculator for founders who've already learned the hard way that "we'll figure out costs later" is how runway disappears.

Section 4: Pricing Page (/pricing)

- `<title>:Pricing – Free Forever + Pro for Teams | LLMMargin`
- `<meta name="description">:LLMMargin is free for founders. Pro unlocks saved scenarios, team sharing, and CSV export for $19/mo. No credit card for the free tier.`
- **H1:** Simple pricing for founders who hate pricing pages
- **Subheadline:** Free forever for solo founders. Pro (\$19/mo) adds saved scenarios, team sharing, and CSV export when your cap table needs it.

Section 7: 10 Blog Post Titles (Tier 3 keyword targets)

1. Title: How Much Does GPT-4o Actually Cost Per User Per Month? (Real SaaS Numbers)

- Target keyword: how much does GPT-4o cost per user per month
- Estimated KD: 8
- URL slug: /blog/gpt-4o-cost-per-user-per-month

2. Title: The AI API Cost for 10,000 Users: Full Breakdown Across GPT-4o, Claude, and Gemini

- Target keyword: AI API cost for 10000 users
- Estimated KD: 6
- URL slug: /blog/ai-api-cost-for-10000-users

3. Title: How to Calculate LLM Cost Per API Call Without Spreadsheet Hell

- Target keyword: calculate LLM cost per API call
- Estimated KD: 12
- URL slug: /blog/calculate-llm-cost-per-api-call

4. Title: LLM Gross Margin Calculator Walkthrough: What Good Looks Like in 2025

- Target keyword: LLM gross margin calculator
- Estimated KD: 9
- URL slug: /blog/llm-gross-margin-benchmarks

5. Title: How to Calculate AI Cost Per User (The Formula Every SaaS Founder Should Know)

- Target keyword: how to calculate AI cost per user
- Estimated KD: 10
- URL slug: /blog/how-to-calculate-ai-cost-per-user

6. Title: Claude API Cost Per User: What Anthropic's Pricing Means for SaaS Margins

- Target keyword: Claude API cost per user
- Estimated KD: 11
- URL slug: /blog/claude-api-cost-per-user

7. Title: The Anthropic API Pricing Calculator Founders Have Been Quietly Begging For

- Target keyword: Anthropic API pricing calculator
- Estimated KD: 14
- URL slug: /blog/anthropic-api-pricing-calculator

8. Title: OpenAI API Pricing Calculator for SaaS: A Founder's Guide to Real Unit Economics

- Target keyword: OpenAI API pricing calculator for SaaS
- Estimated KD: 15
- URL slug: /blog/openai-api-pricing-calculator-for-saas

9. Title: AI API Cost Calculator for SaaS: Stop Using Generic Token Tools

- Target keyword: AI API cost calculator for SaaS
- Estimated KD: 10
- URL slug: /blog/ai-api-cost-calculator-for-saas

10. Title: LLM Margin Calculator: The 4 Numbers Every AI SaaS Founder Should Track Weekly

- Target keyword: LLM margin calculator
- Estimated KD: 7
- URL slug: /blog/llm-margin-calculator-guide

Section 8: Model-Specific Landing Page Template

URL pattern: /`[model-slug]`-cost-calculator

Examples: /gpt-5-cost-calculator, /claude-opus-4-cost-calculator, /gemini-3-cost-calculator

Reusable template

- `<title>:[MODEL] Cost Calculator for SaaS Founders | LLM`Margin
- `<meta description>:Calculate [MODEL] cost per user, gross margin, and breakeven MAU for your AI SaaS. Live pricing, real unit economics, no spreadsheet required.`
- `H1:[MODEL] cost calculator – model your SaaS margin in 60 seconds`
- `Lede (2 sentences):[MODEL] just shipped, and its pricing changes what your AI product costs to run. Plug your token usage and MAU into this calculator to see cost per user, gross margin, and breakeven under the new rates.`

Unique "why this pricing is notable" paragraphs

GPT-5 (/gpt-5-cost-calculator)

GPT-5's pricing matters because OpenAI reset the ratio between input and output tokens — and most SaaS products are output-heavy. If your app generates long completions (summaries, code, long-form writing), your per-user cost under GPT-5 can move materially compared to GPT-4o even at headline "cheaper" rates. This calculator splits prompt and completion tokens separately so you see the real blended cost for your workload, not the marketing number.

Claude Opus 4 (/claude-opus-4-cost-calculator)

Claude Opus 4 sits at the premium end of Anthropic's lineup, and that pricing profile creates a specific trap for SaaS founders: power users can silently 10x your blended cost per user before the dashboard catches it. Opus 4 is worth it for hard reasoning workloads — but only if you've routed cheaper traffic to Haiku or Sonnet. This calculator models tiered routing so you can see margin with and without a fallback model, and catch the power-user risk before it shows up on the invoice.
